16. Abstract

The objective of the Bus Transit Monitoring Study is to develop a method for the design of comprehensive, statistically based data collection programs for the bus transit industry to support the short range planning process. The two volumes of this manual document this method and provide transit operators with step-by-step procedures to develop their own individually-tailored programs. This volume, Volume 2, Sample Size Tables, provides an extensive set of tables for determining sample sizes for systems and routes of varying size and operating characteristics. Volume 1, Data Collection Design, explains the various components of a comprehensive, route-level data collection program, beginning with the determination of data needs and finishing with interpretation of the data. A two-stage approach is described with a baseline phase to produce detailed profiles for each bus route, and a monitoring phase to gather limited data on a periodic basis. The advantages and disadvantages of various data collection techniques are discussed. Both the desired accuracy and the inherent variability of the data items are incorporated in the selection of a sampling plan. Allowance is made for the use of simple linear relationships between data items to reduce the overall cost of the data collection program where feasible. The recommended data collection program is shown to meet UMTA Section 15 reporting requirements for passenger related data.

FOREWORD

Many transit operators have adopted sets of service performance measures and standards and have developed plans to use them in a systematic evaluation. In many cases, however, transit operators have not been able to implement the measures and standards because they have had difficulty in developing a cost-effective system to collect the needed information. To assist these operators, UMTA's Office of Planning Assistance, through its Special Studies Program, has sponsored a study in data collection.

This two-volume manual is the product of this study which documents a method to develop comprehensive statistically based data collection programs that will enable transit operators to collect passenger-related data in a cost-effective manner. We believe the step-by-step procedures provided in this manual will be of value to transit operators in their efforts to improve their data collection systems.

Additional copies of this report are available from the National Technical Information Service (NTIS), Springfield, Virginia 22161. Please reference UMTA-IT-09-9008-81-1 on the request.

The preparation of this report has been financed through a contract from the U.S. Department of Transportation, under the Urban Mass Transportation Act of 1964, as amended. The contents of this report were prepared by Multisystems, Inc. and ATE Management and Service Co., Inc. and do not necessarily reflect the official views or policies of the U.S. Department of Transportation of the Urban Mass Transportation Administration.

HOW TO USE THIS MANUAL

This manual consists of two volumes: Data Collection Design (Volume 1) and Sample Size Tables (Volume 2). Together, the two volumes of this manual provide transit properties with the necessary information to design a comprehensive bus service monitoring program.

This volume, Sample Size Tables, provides an extensive set of tables for determining sample sizes for systems and routes of varying size and operating characteristics. This volume cannot be used alone, but is simply a reference document for users of Volume 1. Instructions for use of the sample size tables are included in Chapters 4 and 6 of Volume 1.

Volume 1, Data Collection Design, explains the various components of a comprehensive data collection program, beginning with the determination of data needs and finishing with interpretation of the data. The first five chapters of Volume 1 provide a basic framework for step-by-step program design procedures which are presented in an instruction/example format in Chapter 6. As such, it is important for the user of this manual to read the first five chapters before attempting to use the procedures outlined in Chapter 6. Once familiar with the basic concepts and practical considerations which are discussed in detail in Chapters 1-5, the user can proceed to use the design procedures in Chapter 6 where the underlying framework and assumptions are largely unstated. The user will also need to refer to the detailed statistical discussions and work sheets contained in Appendix A of Volume 1 in order to fully carry out the program design procedures outlined in Chapter 6.

GENERAL INSTRUCTIONS

This volume, Sample Size Tables, consists of a set of detailed sample size tables which can be used to determine a variety of route sampling plans for any data item. Three input items are needed to use the tables (as discussed in Chapter 4 of Volume 1, Data Collection Program Design):

- the within-day coefficient of variation
- the between-day coefficient of variation
- the number of scheduled (round) trips.

These inputs are determined for each data item and time period during the day to be sampled. (See Chapters 4 and 6 and Appendix A of Volume 1 for more discussion of how and when use these tables in a route monitoring program.)

The tables in this volume are "black tab" indexed by the within-day coefficient of variation in order of increasing coefficient values at intervals of .10 (starting with .20 and ending with .80). Within each section representing one value of the within-day coefficient, the between-day coefficients of variation are included in order of increasing values at various intervals (i.e., .06, .07, .08, .09, .10, .11, .12, .13, .14, .15, .20, .25, .30). Next to each black tab, the value of the table's corresponding between-day coefficient is printed for easy reference. Within each between-day coefficient value, nine different scheduled trip values are included in order of increasing number of trips (i.e., 2, 4, 6, 8, 10, 15, 20, 25, 30, 40).

If a user wants to find the proper table for an input value which falls between the values for which tables have been prepared, he should go to the next highest value which is included (so that the required sample will never be underestimated). If this procedure is used in the case of the number of scheduled trips, it is possible that the required sample for any selected tolerance level could be higher than the actual number of trips, since the table used has been

prepared for a higher number of scheduled trips. In this case, the user should lower the number of required trips to the value of the actual scheduled trips in the period, while not changing the required number of days to be sampled.
